Soloman Northrop

Lead Software Engineer | Full-Stack, Robotics and AI Platforms | C#/.NET, TypeScript, Flutter, Unity

St. Petersburg, FL (remote) | sxnorthrop15@gmail.com | linkedin.com/in/soloman-northrop-376420129 | github.com/sollaholla | sollaholla.github.io

SUMMARY

Lead software engineer with seven years of production work. I build complete platforms as the only engineer on them. That includes a Flutter robotics control platform running on a commercial security robot, a WebXR physical-therapy platform used in 15+ clinics, and a multi-tenant cloud platform for streaming and AR/VR. My main languages are C#/.NET and TypeScript. I also ship in Flutter, Unity and Python. I have put LLMs, on-device computer vision and physics simulation into products that customers use. I own the work from design through release.

SKILLS

Languages: C#, TypeScript/JavaScript, Dart, Python, SQL

Backend and data: ASP.NET Core, Entity Framework, Node.js, Express, Colyseus, PostgreSQL, SQL Server, Supabase, REST APIs, webhooks, multi-tenant architecture, Hangfire

Front end and apps: React, Vite, Svelte, Three.js, Flutter, Unity, WebXR, Expo/React Native, Electron, Razor

Cloud and delivery: AWS (ECS Fargate, ALB, EFS, ECR, SES), Fly.io, Cloudflare, Auth0, Docker, GitHub Actions, CI with automated tests (node:test, Playwright, flutter_test), multi-platform release builds

AI and robotics: LLM integration (OpenAI including realtime voice, Gemini, Claude), agent orchestration and MCP, on-device inference (ONNX Runtime, TFLite, TensorRT on Jetson), YOLO, depth and segmentation deployment, ZED stereo vision, GNSS/RTK, mapping and navigation, physics simulation (Rapier, WebGPU), serial and firmware protocols

EXPERIENCE

Lead Software Engineer (full-time) | Robocor — Apr 2024 – Present

Remote, Florida

- I am the only software engineer at Robocor. I built Robocor 2.0, the software that runs the company's security robots, from the firmware link up to the operator app and the cloud.
- Shipped the Guardian robot to a live customer site, Nimnicht Chevrolet.
- Put computer vision on the robot itself, so it can detect objects and judge distance without a cloud service.
- Built a voice agent on OpenAI so staff can talk to the robot.
- Built corBench, a simulator that runs the real robot code before it goes on hardware. It has logged 580+ runs.
- Wrote one Flutter app for desktop, mobile and web, with automated releases for Windows, macOS and Jetson.

Software Developer III, Full Stack | VEERA Medical — Apr 2023 – Present

Hybrid, United States

- I built and launched MedXR (Recovr360) alone. It is a white-label physical therapy platform. The patient wears a Meta Quest headset and the practitioner runs the session from a browser. It is in use at more than 15 clinics.
- Wrote the real-time backend in Node and TypeScript, the WebXR client in Svelte and Three.js, and the native Quest client.
- Moved the platform from Fly.io to AWS ECS and rolled out Auth0 login behind feature flags.
- Added support for the Xbox Adaptive Controller and wheelchair joysticks, so more patients can use it.
- Presented the platform live at ACRM 2023, where a practicing clinician ran the wireless demo.

Software Developer II | VEERA Medical — Oct 2021 – Mar 2023

- Built the first VEERA Medical cross-platform application in C#, Unity, JavaScript and ASP.NET Core, on the Reach Cloud codebase I co-authored. Razor UIs, authentication and the clinician data pipeline.

Co-Founder and Lead Engineer (side venture) | Reach Cloud — Jan 2022 – Present

Remote, St. Petersburg, FL

- Built and maintain a multi-tenant cloud platform for streaming, remote device management and cross-platform multiplayer VR/AR/MR, with a Unity SDK and public API. Live at reachcloud.org.

- Wrote the developer docs and the C# generator that builds them. Set the engineering roadmap and shipped across platforms.

Junior Software Application Programmer | Cardno May 2019 – Sep 2023

Clearwater, FL

- Started part-time out of college, then full-time. Maintained and extended the Georgia DOT permit system in C# and SQL. Added batch reporting and export, and Hangfire background processing. Made the site faster.

INDEPENDENT PRODUCTS

- Solla Code (github.com/sollaholla/sollacode): I maintain this open-source fork of T3 Code for running several AI coding agents at once. I added custom agents, scheduled tasks, side chats and an orchestrator, and I grew its MCP tools and shared browser. I have made 850+ commits since July 2026.
- SkyCal (skycalapp.com): family calendar and planning SaaS in React, TypeScript and Vite on Supabase. Stripe household billing, Google and Outlook calendar sync (Microsoft Graph), a GPT realtime voice assistant and a referral program; 50+ test files including Stripe sandbox tests.

EDUCATION

St. Petersburg College | Associate of Science, Computer Programming | 2016 – 2017
